Everything You Need To Know About Chemotherapy

Click on the image below to see the actual CURRENT death statistics.

This web page has been posted to give you access to many articles pointing out the toxicity and other serious dangers of widely prescribed drugs known as chemotherapy medicines. What is so insane about the medical industry's use of these drugs is that most, if not all of these types of drugs are KNOWN CARCINOGENS – meaning that they actually CAUSE cancer! More cancer means more money for the people pretending to help cure you of your illnesses. Yes folks, the system is rigged, highly rigged, AGAINST you and me. Want proof? Just check out the videos on this page:

Chemo drugs are cryptically referred to as "Cytotoxic Drugs". Did your oncologist (cancer doctor) ever tell you this? Probably not. So what exactly are Cytotoxic Drugs? Well here is a somewhat cryptic medical definition:

"Cytotoxic drugs (CDs) are primarily used as anti-cancer drugs ***because they are toxic to cells****. These drugs have been associated with human cancers at high (therapeutic) levels of exposure and are carcinogens and teratogens in many animal species. Under current work practices, CDs have demonstrated the ability to cause elevations in sister chromatid exchanges and* ***chromosome breakage*** *in circulating lymphocytes and mutagenic activity in urine. In addition, many of these drugs have been shown to cause a variety of acute effects in humans, such as localized skin necrosis (death of tissue) after surface contact with abraded skin or damage to normal skin."* [1]

Suggested Articles About Chemotherapy:

DISCLAIMER: Remember to consult your poison-supplier – I mean oncologist – before trying to do anything cheap, safe and effective to fight your cancer, without first getting approval from the medical charlatans who are licensed, paid and controlled by Big Pharma, to treat you, not to heal you. And in case you were not aware, the major medical insurance companies are in bed with the pharmaceutical industry, so

they will approve just about anything the doctors order, unless, you stay sick too long before they kill you, at which point the insurance companies will cease paying for your treatments and let you die.

GUIDELINES FOR THE USE OF CYTOTOXIC OR CHEMOTHERAPEUTIC DRUGS – detailed

instructions for safe handling of TOXIC chemo meds

“THE SEARCH FOR effective anticancer chemotherapeutic agents has long been hampered by the many drawbacks to effective treatment, which is often limited by a lack of specificity for malignant tissue and troublesome side effects. One of the more distressing aspects of anticancer drugs is that many of them can be carcinogens. The very mechanisms that make them lethal to cancer cells can render them carcinogenic to normal cells by causing malignant genetic mutations and interfering with cellular repair machinery.” [2]

“Most patients with cancer receive chemotherapy. Unfortunately, chemotherapy is associated with a number of potentially life-threatening side effects. There is a need to ameliorate [they mean “lessen”] chemotoxicity to improve therapeutic outcomes and quality of life. Chemotoxicity arises from systemic DNA damage and inflammation in healthy cells due to chemotherapy drugs.” [3]
